# Chapter 1

## Overview

The libspe2 functionality is split into 4 libraries:

- **libspe-base** This library provides the basic infrastructure to manage and use SPEs. The central data structure is a SPE context `spe_context`. It contains all information necessary to manage an SPE, run code on it, communicate with it, and so on. To use the libspe-base library, the header file `spebase.h` has to be included and an application needs to link against `libspebase.a` or `libspebase.so`.
- **libspe-event** This is a convenience library for the handling of events generated by an SPE. It is based on libspe-base and epoll. Since the `spe_context` introduced by libspe-base contains the file descriptors to mailboxes etc, any other event handling mechanism could also be implemented based on libspe-base.

### 1.1 Terminology

- **main thread** usually the application main thread running on a PPE
- **SPE thread** a thread that uses SPEs. Execution starts on the PPE. Execution shifts between PPE and an SPE back and fro, e.g., PPE services system calls for SPE transparently

### 1.2 Usage Scenarios

#### 1.2.1 Single-threaded sample

Note: In the new model, it is not necessary to have a main thread - the SPE thread can be the only application thread. It may run parts of its code on PPE and then start an SPE, e.g., for an accelerated function. The main thread is needed only if you want to use multiple SPEs concurrently. The following minimalistic sample illustrates the basic steps:

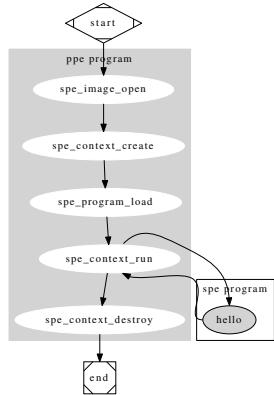

Figure 1.1: Simple program

Here is the same sample with some error checking:

### 1.2.2 Multi-threaded sample

This illustrates a threaded sample using the pthread library:

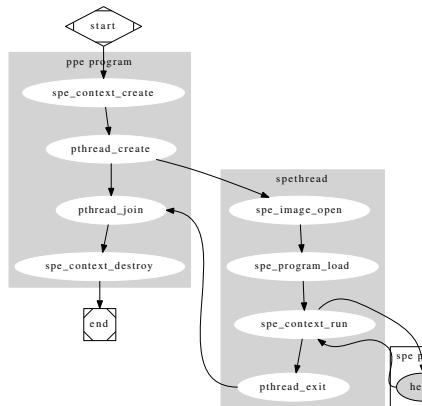

Figure 1.2: Simple pthread program

Here is the same sample with some error checking:

### 1.2.3 Problem state mapping samples

This illustrates accessing the MFC Local Store Address Register.

### 1.2.4 Event samples

This illustrates a sample using the event library. The event, which we receive is of course that the spu program has stopped, because otherwise we would not get there.

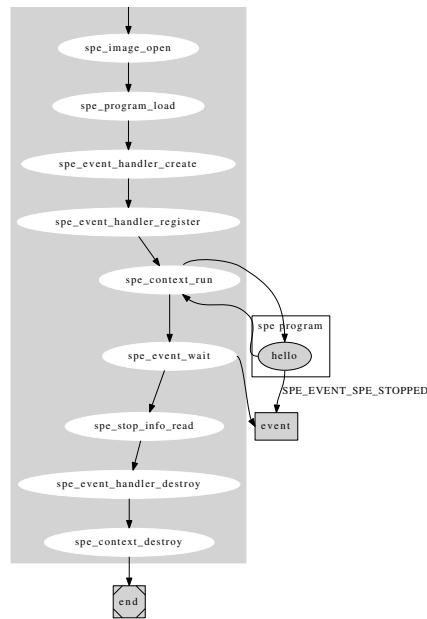

Figure 1.3: Simple event program

Events are more useful in multithreaded environments:

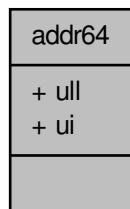

## Chapter 2

# Data Structure Documentation

### 2.1 addr64 Union Reference

```
#include <elf_loader.h>
```

Collaboration diagram for addr64:

#### Data Fields

- unsigned long long **ull**
- unsigned int **ui** [2]

#### 2.1.1 Detailed Description

Definition at line 28 of file elf\_loader.h.

#### 2.1.2 Field Documentation

##### **unsigned int ui[2]**

Definition at line 31 of file elf\_loader.h.

Referenced by `_base_spe_context_run()`.

**unsigned long long ull**

Definition at line 30 of file elf\_loader.h.

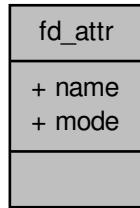

Referenced by \_base\_spe\_context\_run().

The documentation for this union was generated from the following file:

- [elf\\_loader.h](#)

## 2.2 fd\_attr Struct Reference

Collaboration diagram for fd\_attr:

### Data Fields

- [const char \\* name](#)
- [int mode](#)

#### 2.2.1 Detailed Description

Definition at line 37 of file create.c.

#### 2.2.2 Field Documentation

##### **int mode**

Definition at line 39 of file create.c.

Referenced by \_base\_spe\_open\_if\_closed().

##### **const char\* name**

Definition at line 38 of file create.c.

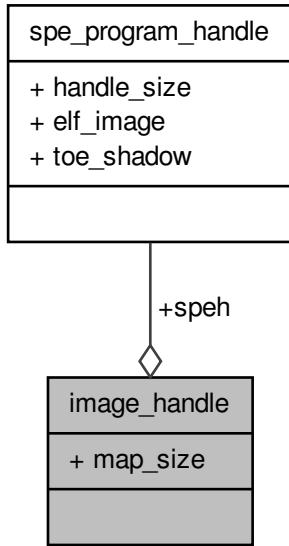

Referenced by \_base\_spe\_open\_if\_closed().

The documentation for this struct was generated from the following file:

- [create.c](#)

## 2.3 image\_handle Struct Reference

Collaboration diagram for image\_handle:

### Data Fields

- `spe_program_handle_t speh`
- `unsigned int map_size`

#### 2.3.1 Detailed Description

Definition at line 32 of file image.c.

#### 2.3.2 Field Documentation

##### `unsigned int map_size`

Definition at line 34 of file image.c.

Referenced by `_base_spe.image_close()`, and `_base_spe.image_open()`.

##### `spe_program_handle_t speh`

Definition at line 33 of file image.c.

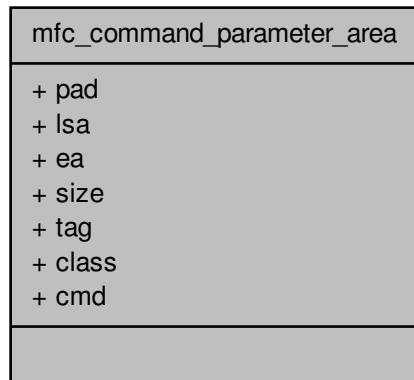

Referenced by `_base_spe.image_close()`, and `_base_spe.image_open()`.

The documentation for this struct was generated from the following file:

- `image.c`

## 2.4 mfc\_command\_parameter\_area Struct Reference

```
#include <dma.h>
Collaboration diagram for mfc_command_parameter_area:
```

### Data Fields

- uint32\_t [pad](#)
- uint32\_t [lsa](#)
- uint64\_t [ea](#)
- uint16\_t [size](#)
- uint16\_t [tag](#)
- uint16\_t [class](#)
- uint16\_t [cmd](#)

#### 2.4.1 Detailed Description

Definition at line 27 of file dma.h.

#### 2.4.2 Field Documentation

##### [uint16\\_t class](#)

Definition at line 33 of file dma.h.

##### [uint16\\_t cmd](#)

Definition at line 34 of file dma.h.

##### [uint64\\_t ea](#)

Definition at line 30 of file dma.h.

**uint32\_t lsa**

Definition at line 29 of file dma.h.

**uint32\_t pad**

Definition at line 28 of file dma.h.

**uint16\_t size**

Definition at line 31 of file dma.h.

**uint16\_t tag**

Definition at line 32 of file dma.h.

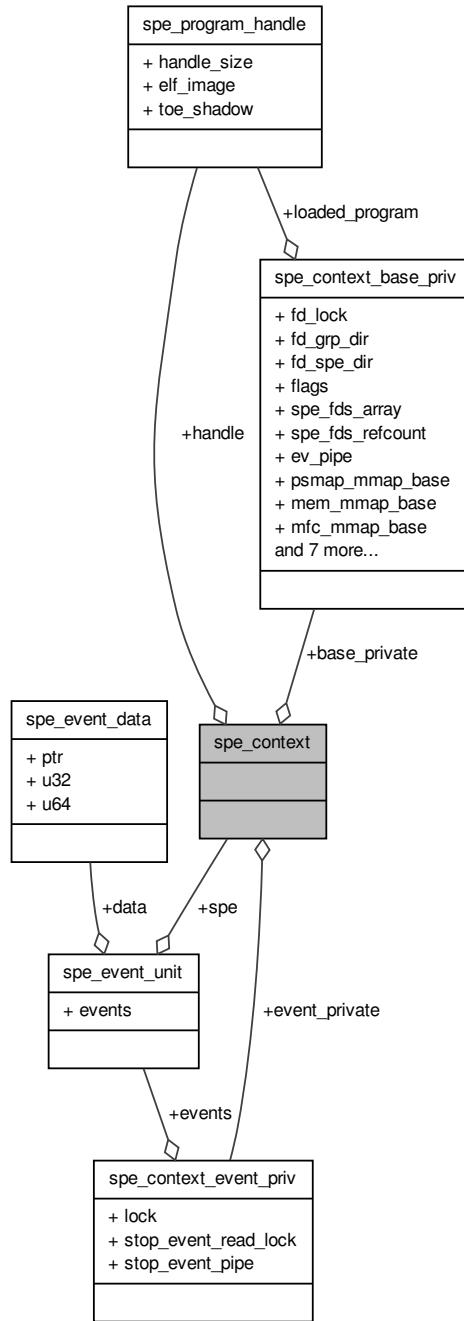

The documentation for this struct was generated from the following file:

- [dma.h](#)

## 2.5 spe\_context Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for spe\_context:

## Data Fields

- `spe_program_handle_t handle`
- struct `spe_context_base_priv * base_private`

- struct [spe\\_context\\_event\\_priv](#) \* event\_private

### 2.5.1 Detailed Description

**SPE context** The SPE context is one of the base data structures for the libspe2 implementation. It holds all persistent information about a "logical SPE" used by the application. This data structure should not be accessed directly, but the application uses a pointer to an SPE context as an identifier for the "logical SPE" it is dealing with through libspe2 API calls.

Definition at line 64 of file libspe2-types.h.

### 2.5.2 Field Documentation

#### **struct spe\_context\_base\_priv\* base\_private**

Definition at line 76 of file libspe2-types.h.

Referenced by `_base_spe_spe_dir_get()`, `_base_spe_stop_event_source_get()`, `_base_spe_stop_event_target_get()`, `_base_spe_close_if_open()`, `_base_spe_context_create()`, `_base_spe_context_lock()`, `_base_spe_context_run()`, `_base_spe_context_unlock()`, `_base_spe_handle_library_callback()`, `_base_spe_in_mbox_status()`, `_base_spe_in_mbox_write()`, `_base_spe_ls_area_get()`, `_base_spe_mfcio_tag_status_read()`, `_base_spe_mssync_start()`, `_base_spe_mssync_status()`, `_base_spe_open_if_closed()`, `_base_spe_out_intr_mbox_status()`, `_base_spe_out_mbox_read()`, `_base_spe_out_mbox_status()`, `_base_spe_program_load()`, `_base_spe_program_load_complete()`, `_base_spe_ps_area_get()`, `_base_spe_signal_write()`, and `_event_spe_event_handler_register()`.

#### **struct spe\_context\_event\_priv\* event\_private**

Definition at line 77 of file libspe2-types.h.

#### **spe\_program\_handle\_t handle**

Definition at line 72 of file libspe2-types.h.

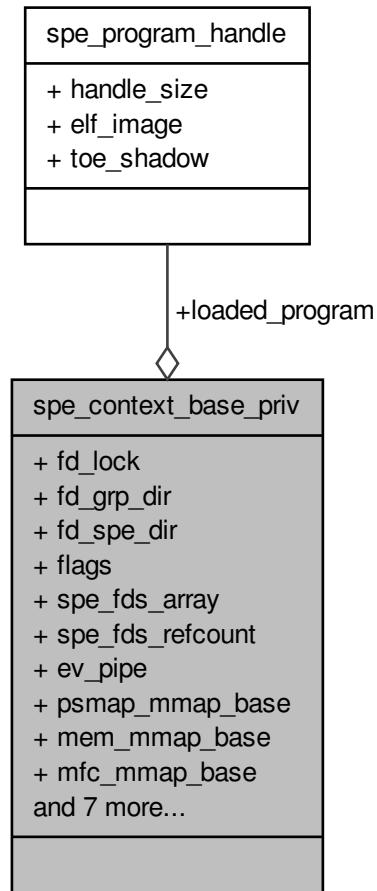

The documentation for this struct was generated from the following file:

- [libspe2-types.h](#)

## 2.6 spe\_context\_base\_priv Struct Reference

```
#include <spebase.h>
```

Collaboration diagram for spe\_context\_base\_priv:

## Data Fields

- pthread\_mutex\_t `fd_lock` [NUM\_MBOX\_FDS]
- int `fd_grp_dir`
- int `fd_spe_dir`
- unsigned int `flags`
- int `spe_fds_array` [NUM\_MBOX\_FDS]
- int `spe_fds_refcount` [NUM\_MBOX\_FDS]
- int `ev_pipe` [2]
- void \* `psmmap_mmap_base`
- void \* `mem_mmap_base`
- void \* `mfc_mmap_base`
- void \* `mssync_mmap_base`
- void \* `cntl_mmap_base`

- void \* `signal1_mmap_base`
- void \* `signal2_mmap_base`
- int `entry`
- `spe_program_handle_t` \* `loaded_program`
- int `emulated_entry`
- int `active_tagmask`

### 2.6.1 Detailed Description

Definition at line 61 of file spebase.h.

### 2.6.2 Field Documentation

#### **int active\_tagmask**

Definition at line 108 of file spebase.h.

Referenced by `_base_spe_mfcio_tag_status_read()`.

#### **void\* cntl\_mmap\_base**

Definition at line 88 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_in_mbox_status()`, `_base_spe_out_intr_mbox_status()`, `_base_spe_out_mbox_status()`, and `_base_spe_ps_area_get()`.

#### **int emulated\_entry**

Definition at line 103 of file spebase.h.

Referenced by `_base_spe_context_run()`, and `_base_spe_program_load()`.

#### **int entry**

Definition at line 93 of file spebase.h.

Referenced by `_base_spe_context_run()`, and `_base_spe_program_load()`.

#### **int ev\_pipe[2]**

Definition at line 81 of file spebase.h.

Referenced by `_base_spe_stop_event_source_get()`, and `_base_spe_stop_event_target_get()`.

#### **int fd\_grp\_dir**

Definition at line 68 of file spebase.h.

#### **pthread\_mutex\_t fd\_lock[NUM\_MBOX\_FDS]**

Definition at line 65 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_context_lock()`, and `_base_spe_context_unlock()`.

#### **int fd\_spe\_dir**

Definition at line 71 of file spebase.h.

Referenced by `_base_spe_spe_dir_get()`, `_base_spe_context_create()`, `_base_spe_context_run()`, `_base_spe_open_if_closed()`, and `_base_spe_program_load_complete()`.

**unsigned int flags**

Definition at line 74 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_context_run()`, `_base_spe_handle_library_callback()`, `_base_spe_in_mbox_status()`, `_base_spe_in_mbox_write()`, `_base_spe_mfcio_tag_status_read()`, `_base_spe_mssync_start()`, `_base_spe_mssync_status()`, `_base_spe_out_intr_mbox_status()`, `_base_spe_out_mbox_read()`, `_base_spe_out_mbox_status()`, `_base_spe_program_load()`, `_base_spe_signal_write()`, and `_event_spe_event_handler_register()`.

**spe\_program\_handle\_t\* loaded\_program**

Definition at line 99 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_program_load()`, and `_base_spe_program_load_complete()`.

**void\* mem\_mmap\_base**

Definition at line 85 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_context_run()`, `_base_spe_handle_library_callback()`, `_base_spe_ls_area_get()`, and `_base_spe_program_load()`.

**void\* mfc\_mmap\_base**

Definition at line 86 of file spebase.h.

Referenced by `_base_spe_context_create()`, and `_base_spe_ps_area_get()`.

**void\* mssync\_mmap\_base**

Definition at line 87 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_mssync_start()`, `_base_spe_mssync_status()`, and `_base_spe_ps_area_get()`.

**void\* psmmap\_mmap\_base**

Definition at line 84 of file spebase.h.

Referenced by `_base_spe_context_create()`.

**void\* signal1\_mmap\_base**

Definition at line 89 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_ps_area_get()`, and `_base_spe_signal_write()`.

**void\* signal2\_mmap\_base**

Definition at line 90 of file spebase.h.

Referenced by `_base_spe_context_create()`, `_base_spe_ps_area_get()`, and `_base_spe_signal_write()`.

**int spe\_fds\_array[NUM\_MBOX\_FDS]**

Definition at line 77 of file spebase.h.

Referenced by `_base_spe_close_if_open()`, `_base_spe_context_create()`, and `_base_spe_open_if_closed()`.

```
int spe_fds_refcount[NUM_MBOX_FDS]
```

Definition at line 78 of file spebase.h.

Referenced by \_base\_spe\_close\_if\_open(), and \_base\_spe\_open\_if\_closed().

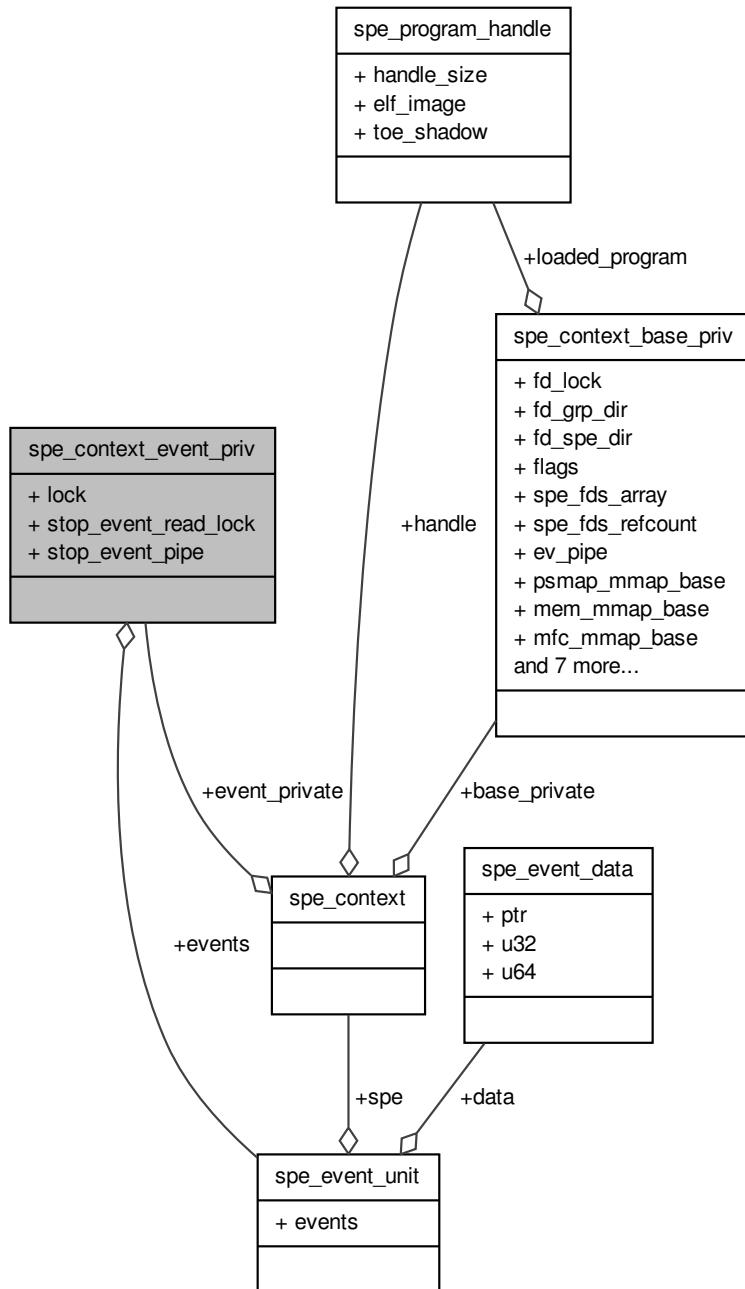

The documentation for this struct was generated from the following file:

- [spebase.h](#)

## 2.7 spe\_context\_event\_priv Struct Reference

```
#include <speevent.h>
```

Collaboration diagram for spe\_context\_event\_priv:

## Data Fields

- `pthread_mutex_t lock`
- `pthread_mutex_t stop_event_read_lock`

- int stop\_event\_pipe [2]
- spe\_event\_unit\_t events [\_NUM\_SPE\_EVENT\_TYPES]

### 2.7.1 Detailed Description

Definition at line 35 of file speevent.h.

### 2.7.2 Field Documentation

#### **spe\_event\_unit\_t events[\_NUM\_SPE\_EVENT\_TYPES]**

Definition at line 40 of file speevent.h.

Referenced by \_event\_spe\_context\_initialize(), \_event\_spe\_event\_handler\_deregister(), and \_event\_spe\_event\_handler\_register().

#### **pthread\_mutex\_t lock**

Definition at line 37 of file speevent.h.

Referenced by \_event\_spe\_context\_finalize(), and \_event\_spe\_context\_initialize().

#### **int stop\_event\_pipe[2]**

Definition at line 39 of file speevent.h.

Referenced by \_event\_spe\_context\_finalize(), \_event\_spe\_context\_initialize(), \_event\_spe\_context\_run(), \_event\_spe\_event\_handler\_deregister(), \_event\_spe\_event\_handler\_register(), and \_event\_spe\_stop\_info\_read().

#### **pthread\_mutex\_t stop\_event\_read\_lock**

Definition at line 38 of file speevent.h.

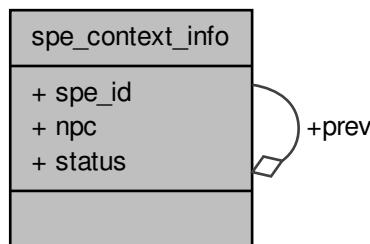

Referenced by \_event\_spe\_context\_finalize(), \_event\_spe\_context\_initialize(), and \_event\_spe\_stop\_info\_read().

The documentation for this struct was generated from the following file:

- speevent.h

## 2.8 spe\_context\_info Struct Reference

Collaboration diagram for spe\_context\_info:

## Data Fields

- int [spe\\_id](#)
- unsigned int [npc](#)
- unsigned int [status](#)
- struct [spe\\_context\\_info](#) \* [prev](#)

### 2.8.1 Detailed Description

Definition at line 40 of file run.c.

### 2.8.2 Field Documentation

#### **unsigned int npc**

Definition at line 42 of file run.c.

Referenced by [\\_base\\_spe\\_context\\_run\(\)](#).

#### **struct spe\_context\_info\* prev**

Definition at line 44 of file run.c.

Referenced by [\\_base\\_spe\\_context\\_run\(\)](#).

#### **int spe\_id**

Definition at line 41 of file run.c.

Referenced by [\\_base\\_spe\\_context\\_run\(\)](#).

#### **unsigned int status**

Definition at line 43 of file run.c.

Referenced by [\\_base\\_spe\\_context\\_run\(\)](#).

The documentation for this struct was generated from the following file:

- [run.c](#)

## 2.9 spe\_event\_data Union Reference

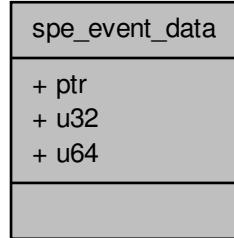

```
#include <libspe2-types.h>
```

Collaboration diagram for spe\_event\_data:

```

graph TD
    A[spe_event_data] --- B[+ ptr]
    A --- C[+ u32]
    A --- D[+ u64]

```

## Data Fields

- void \* [ptr](#)
- unsigned int [u32](#)
- unsigned long long [u64](#)

### 2.9.1 Detailed Description

`spe_event_data_t` User data to be associated with an event  
Definition at line 143 of file libspe2-types.h.

### 2.9.2 Field Documentation

#### `void* ptr`

Definition at line 145 of file libspe2-types.h.  
Referenced by `_event_spe_event_handler_register()`.

#### `unsigned int u32`

Definition at line 146 of file libspe2-types.h.

#### `unsigned long long u64`

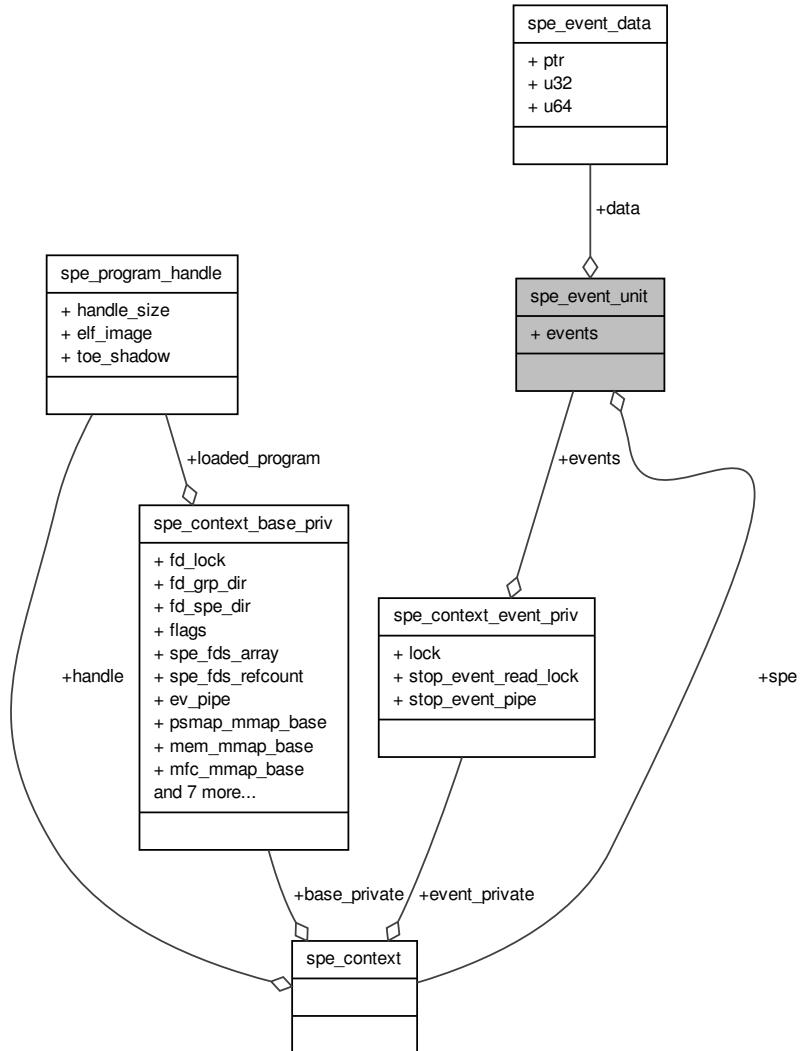

Definition at line 147 of file libspe2-types.h.  
The documentation for this union was generated from the following file:

- [libspe2-types.h](#)

## 2.10 spe\_event\_unit Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for spe\_event\_unit:

## Data Fields

- `unsigned int events`
- `spe_context_ptr_t spe`
- `spe_event_data_t data`

### 2.10.1 Detailed Description

`spe_event_t`

Definition at line 152 of file libspe2-types.h.

### 2.10.2 Field Documentation

#### `spe_event_data_t data`

Definition at line 156 of file libspe2-types.h.

Referenced by `_event_spe_event_handler_register()`.

#### `unsigned int events`

Definition at line 154 of file libspe2-types.h.

Referenced by `_event_spe_event_handler_deregister()`, and `_event_spe_event_handler_register()`.

#### `spe_context_ptr_t spe`

Definition at line 155 of file libspe2-types.h.

Referenced by `_event_spe_context_initialize()`, `_event_spe_event_handler_deregister()`, `_event_spe_event_handler_register()`, and `_event_spe_event_wait()`.

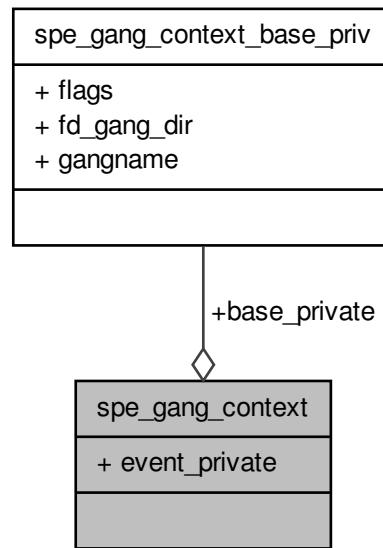

The documentation for this struct was generated from the following file:

- [libspe2-types.h](#)

## 2.11 spe\_gang\_context Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for spe\_gang\_context:

### Data Fields

- struct [spe\\_gang\\_context\\_base\\_priv](#) \* `base_private`

- struct  
spe\_gang\_context\_event\_priv \* **event\_private**

### 2.11.1 Detailed Description

SPE gang context The SPE gang context is one of the base data structures for the libspe2 implementation. It holds all persistent information about a group of SPE contexts that should be treated as a gang, i.e., be execute together with certain properties. This data structure should not be accessed directly, but the application uses a pointer to an SPE gang context as an identifier for the SPE gang it is dealing with through libspe2 API calls.

Definition at line 94 of file libspe2-types.h.

### 2.11.2 Field Documentation

**struct spe\_gang\_context\_base\_priv\* base\_private**

Definition at line 99 of file libspe2-types.h.

Referenced by `_base_spe_context_create()`, and `_base_spe_gang_context_create()`.

**struct spe\_gang\_context\_event\_priv\* event\_private**

Definition at line 100 of file libspe2-types.h.

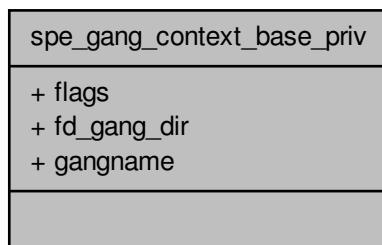

The documentation for this struct was generated from the following file:

- [libspe2-types.h](#)

## 2.12 spe\_gang\_context\_base\_priv Struct Reference

#include <spebase.h>

Collaboration diagram for spe\_gang\_context\_base\_priv:

### Data Fields

- unsigned int **flags**
- int **fd\_gang\_dir**
- char **gangname** [256]

### 2.12.1 Detailed Description

[spe\\_context](#): This holds the persistant information of a SPU instance it is created by spe\_create\_context()  
Definition at line 150 of file spebase.h.

### 2.12.2 Field Documentation

#### int fd\_gang\_dir

Definition at line 156 of file spebase.h.

#### unsigned int flags

Definition at line 153 of file spebase.h.

#### char gangname[256]

Definition at line 158 of file spebase.h.

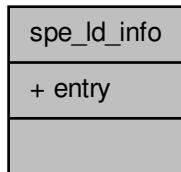

Referenced by \_base\_spe\_context\_create(), and \_base\_spe\_gang\_context\_create().

The documentation for this struct was generated from the following file:

- [spebase.h](#)

## 2.13 spe\_ld\_info Struct Reference

```
#include <elf_loader.h>
Collaboration diagram for spe_ld_info:
```

### Data Fields

- [unsigned int entry](#)

### 2.13.1 Detailed Description

Definition at line 34 of file elf\_loader.h.

### 2.13.2 Field Documentation

#### `unsigned int entry`

Definition at line 36 of file `elf_loader.h`.

Referenced by `_base_spe_load_spe_elf()`, and `_base_spe_program_load()`.

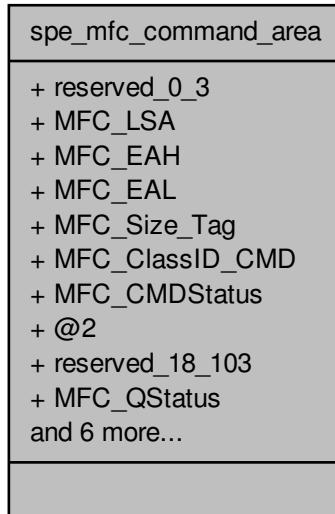

The documentation for this struct was generated from the following file:

- [elf\\_loader.h](#)

## 2.14 spe\_mfc\_command\_area Struct Reference

```
#include <cbea_map.h>
```

Collaboration diagram for `spe_mfc_command_area`:

### Data Fields

- `unsigned char reserved_0_3 [4]`
- `unsigned int MFC_LSA`
- `unsigned int MFC_EAH`
- `unsigned int MFC_EAL`
- `unsigned int MFC_Size_Tag`
- `union {`
- `unsigned int MFC_ClassID_CMD`
- `unsigned int MFC_CMDStatus`
- `};`
- `unsigned char reserved_18_103 [236]`
- `unsigned int MFC_QStatus`

- unsigned char [reserved\\_108\\_203](#) [252]
- unsigned int [Prxy\\_QueryType](#)
- unsigned char [reserved\\_208\\_21B](#) [20]
- unsigned int [Prxy\\_QueryMask](#)
- unsigned char [reserved\\_220\\_22B](#) [12]
- unsigned int [Prxy\\_TagStatus](#)

### 2.14.1 Detailed Description

Definition at line 34 of file cbea\_map.h.

### 2.14.2 Field Documentation

**union { ... }**

**unsigned int MFC\_ClassID\_CMD**

Definition at line 41 of file cbea\_map.h.

**unsigned int MFC\_CMDStatus**

Definition at line 42 of file cbea\_map.h.

**unsigned int MFC\_EAH**

Definition at line 37 of file cbea\_map.h.

**unsigned int MFC\_EAL**

Definition at line 38 of file cbea\_map.h.

**unsigned int MFC\_LSA**

Definition at line 36 of file cbea\_map.h.

**unsigned int MFC\_QStatus**

## 2.16 spe\_program\_handle Struct Reference

```
#include <libspe2-types.h>
```

Collaboration diagram for spe\_program\_handle:

### Data Fields

- `unsigned int handle_size`
- `void * elf_image`
- `void * toe_shadow`

### 2.16.1 Detailed Description

SPE program handle Structure `spe_program_handle` per CESOF specification libspe2 applications usually only keep a pointer to the program handle and do not use the structure directly.

Definition at line 43 of file libspe2-types.h.

### 2.16.2 Field Documentation

#### `void* elf_image`

Definition at line 50 of file libspe2-types.h.

Referenced by `_base_spe_image_close()`, `_base_spe_image_open()`, `_base_spe_load_spe_elf()`, `_base_spe_parse_isolated_elf()`, `_base_spe_program_load_complete()`, `_base_spe_toe_ear()`, and `_base_spe_verify_spe_elf_image()`.

**unsigned int handle\_size**

Definition at line 49 of file libspe2-types.h.

Referenced by `_base_spe_image_open()`.

**void\* toe\_shadow**

Definition at line 51 of file libspe2-types.h.

Referenced by `_base_spe_image_close()`, `_base_spe_image_open()`, and `_base_spe_toe_ear()`.

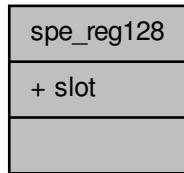

The documentation for this struct was generated from the following file:

- [libspe2-types.h](#)

## 2.17 spe\_reg128 Struct Reference

```
#include <handler_utils.h>
```

Collaboration diagram for spe\_reg128:

### Data Fields

- `unsigned int slot [4]`

#### 2.17.1 Detailed Description

Definition at line 23 of file handler\_utils.h.

#### 2.17.2 Field Documentation

**unsigned int slot[4]**

Definition at line 24 of file handler\_utils.h.

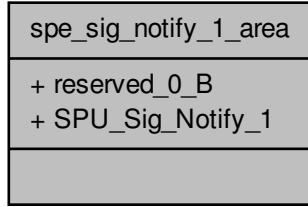

The documentation for this struct was generated from the following file:

- `int __base_spe_stop_event_source_get (spe_context_ptr_t spe)`
- `int __base_spe_stop_event_target_get (spe_context_ptr_t spe)`
- `int __base_spe_ls_size_get (spe_context_ptr_t spe)`

### 3.1.1 Function Documentation

`__attribute__((noinline))`

Definition at line 69 of file accessors.c.

```
70 {
71     return;
72 }
```

`int __base_spe_event_source_acquire ( spe_context_ptr_t spe, enum fd_name fdesc )`

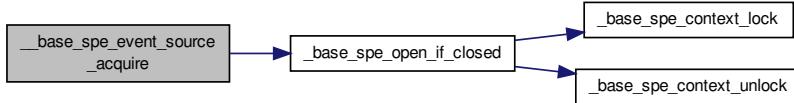

Definition at line 74 of file accessors.c.

References `_base_spe_open_if_closed()`.

Referenced by `_event_spe_event_handler_deregister()`, and `_event_spe_event_handler_register()`.

```
75 {
76     return __base_spe_open_if_closed(spe, fdesc, 0);
77 }
```

Here is the call graph for this function:

`void __base_spe_event_source_release ( struct spe_context *spectx, enum fd_name fdesc )`

`_base_spe_event_source_release` releases the file descriptor to the specified event source

Parameters

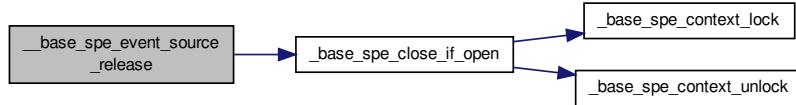

<code>spectx</code>	Specifies the SPE context
<code>fdesc</code>	Specifies the event source

Definition at line 79 of file accessors.c.

References `_base_spe_close_if_open()`.

```
80 {
81     .base_spe_close_if_open(spe, fdesc);
82 }
```

Here is the call graph for this function:

**int \_\_base\_spe\_spe\_dir\_get ( spe\_context\_ptr\_t spe )**

Definition at line 84 of file accessors.c.

References spe\_context::base\_private, and spe\_context\_base\_priv::fd\_spe\_dir.

```

85 {
86     return spe->base_private->fd_spe_dir;
87 }

```

**int \_\_base\_spe\_stop\_event\_source\_get ( spe\_context\_ptr\_t spe )**

speevent users read from this end

Definition at line 92 of file accessors.c.

References spe\_context::base\_private, and spe\_context\_base\_priv::ev\_pipe.

```

93 {
94     return spe->base_private->ev_pipe[1];
95 }

```

**int \_\_base\_spe\_stop\_event\_target\_get ( spe\_context\_ptr\_t spe )**

speevent writes to this end

Definition at line 100 of file accessors.c.

References spe\_context::base\_private, and spe\_context\_base\_priv::ev\_pipe.

```

101 {
102     return spe->base_private->ev_pipe[0];
103 }

```

**void\* \_\_base\_spe\_ls\_area\_get ( spe\_context\_ptr\_t spe )**

Definition at line 64 of file accessors.c.

References spe\_context::base\_private, and spe\_context\_base\_priv::mem\_mmap\_base.

```

65 {
66     return spe->base_private->mem_mmap_base;
67 }

```

**int \_\_base\_spe\_ls\_size\_get ( spe\_context\_ptr\_t spe )**

\_base\_spe\_ls\_size\_get returns the size of the local store area

## Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

Definition at line 105 of file accessors.c.

References LS\_SIZE.

```
106 {
107     return LS_SIZE;
108 }
```

**void\* \_base\_spe\_ps\_area\_get( spe\_context\_ptr\_t spe, enum ps\_area area )**

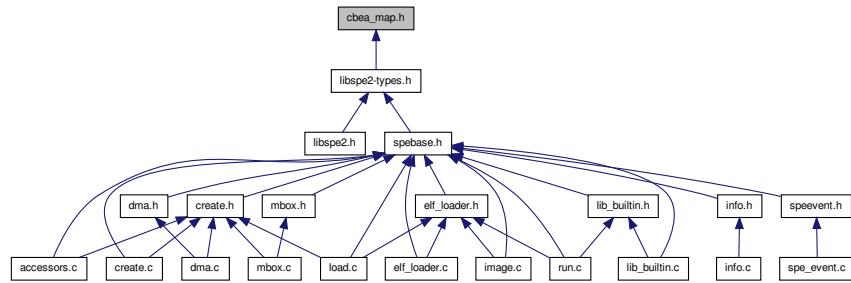

Definition at line 30 of file accessors.c.

References spe\_context::base\_private, spe\_context\_base\_priv::cntl\_mmap\_base, spe\_context\_base\_priv::mfc\_mmap\_base, spe\_context\_base\_priv::mssync\_mmap\_base, spe\_context\_base\_priv::signal1\_mmap\_base, spe\_context\_base\_priv::signal2\_mmap\_base, SPE\_CONTROL\_AREA, SPE\_MFC\_COMMAND\_AREA, SPE\_MSSYNC\_AREA, SPE\_SIG\_NOTIFY\_1\_AREA, and SPE\_SIG\_NOTIFY\_2\_AREA.

### 3.3.1 Function Documentation

`void _base_spe_close_if_open ( struct spe_context *spe, enum fd_name fdesc )`

Definition at line 125 of file create.c.

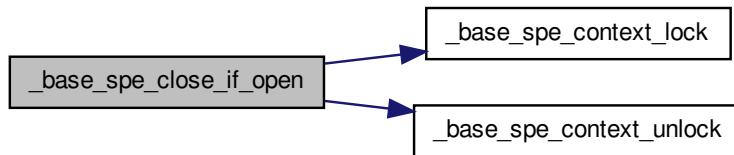

References `_base_spe_context_lock()`, `_base_spe_context_unlock()`, `spe_context::base_private`, `spe_context::base_priv::spe_fds_array`, and `spe_context::base_priv::spe_fds_refcount`.

Referenced by `_base_spe_event_source_release()`, and `_base_spe_signal_write()`.

```

126 {
127     _base_spe_context_lock(spe, fdesc);
128
129     if (spe->base_private->spe_fds_array[(int)fdesc] != -1 &&
130         spe->base_private->spe_fds_refcount[(int)fdesc] == 1) {
131
132         spe->base_private->spe_fds_refcount[(int)fdesc]--;
133         close(spe->base_private->spe_fds_array[(int)fdesc]);
134
135         spe->base_private->spe_fds_array[(int)fdesc] = -1;
136     } else if (spe->base_private->spe_fds_refcount[(int)fdesc] > 0) {
137         spe->base_private->spe_fds_refcount[(int)fdesc]--;
138     }
139
140     _base_spe_context_unlock(spe, fdesc);
141 }
```

Here is the call graph for this function:

`spe_context_ptr_t _base_spe_context_create ( unsigned int flags, spe_gang_context_ptr_t gctx, spe_context_ptr_t aff_spe )`

`_base_spe_context_create` creates a single SPE context, i.e., the corresponding directory is created in SPUFS either as a subdirectory of a gang or individually (maybe this is best considered a gang of one)  
Parameters

<code>flags</code>	
<code>gctx</code>	specify NULL if not belonging to a gang
<code>aff_spe</code>	specify NULL to skip affinity information

Definition at line 183 of file create.c.

References `_base_spe_emulated_loader_present()`, `spe_context::base_private`, `spe_gang_context::base_private`, `spe_context::base_priv::cntl_mmap_base`, `CNTL_OFFSET`, `CNTL_SIZE`, `DEBUG_PRINTF`, `spe_context::base_priv::fd_lock`, `spe_context::base_priv::fd_spe_dir`, `spe_context::base_priv::flags`, `spe_gang_context::base_priv::gangname`, `spe_context::base_priv::loaded_program`, `LS_SIZE`, `spe_context::base_priv::mem_mmap_base`, `spe_context::base_priv::mfc_mmap_base`, `MFC_OFFSET`, `MFC_SIZE`, `MSS_SIZE`, `spe_context::base`

### 3.6.1 Function Documentation

**int \_base\_spe\_mfcio\_get ( spe\_context\_ptr\_t *spectx*, unsigned int *ls*, void \* *ea*, unsigned int *size*, unsigned int *tag*, unsigned int *tid*, unsigned int *rid* )**

The `_base_spe_mfcio_get` function places a get DMA command on the proxy command queue of the SPE thread specified by speid. The get command transfers size bytes of data starting at the effective address specified by ea to the local store address specified by ls. The DMA is identified by the tag id specified by tag and performed according to the transfer class and replacement class specified by tid and rid respectively.

Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

Returns

On success, return 0. On failure, -1 is returned.

Definition at line 160 of file dma.c.

References MFC\_CMD\_GET.

```
167 {
168     return spe_d0_mfc.get(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_GET);
169 }
```

**int \_base\_spe\_mfcio\_getb ( spe\_context\_ptr\_t *spectx*, unsigned int *ls*, void \* *ea*, unsigned int *size*, unsigned int *tag*, unsigned int *tid*, unsigned int *rid* )**

The `_base_spe_mfcio_getb` function is identical to `_base_spe_mfcio_get` except that it places a getb (get with barrier) DMA command on the proxy command queue. The barrier form ensures that this command and all sequence commands with the same tag identifier as this command are locally ordered with respect to all previously issued commands with the same tag group and command queue.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

## Returns

On success, return 0. On failure, -1 is returned.

Definition at line 171 of file dma.c.

References MFC\_CMD\_GETB.

```
178 {
179     return spe_do_mfc_get(spectx, ls, ea, size, tag, rid, rid, MFC_CMD_GETB);
180 }
```

**int \_base\_spe\_mfcio\_getf ( spe\_context\_ptr\_t spectx, unsigned int ls, void \* ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_getf function is identical to \_base\_spe\_mfcio\_get except that it places a getf (get with fence) DMA command on the proxy command queue. The fence form ensure that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

## Returns

On success, return 0. On failure, -1 is returned.

Definition at line 182 of file dma.c.

References MFC\_CMD\_GETF.

```
189 {
190     return spe_do_mfc_get(spectx, ls, ea, size, tag, tid, rid, rid, MFC_CMD_GETF);
191 }
```

**int \_base\_spe\_mfcio\_put ( spe\_context\_ptr\_t spectx, unsigned int ls, void \* ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_put function places a put DMA command on the proxy command queue of the SPE thread specified by speid. The put command transfers size bytes of data starting at the local store address specified by ls to the effective address specified by ea. The DMA is identified by the tag id specified by tag and performed according transfer class and replacement class specified by tid and rid respectively.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

## Returns

On success, return 0. On failure, -1 is returned.

Definition at line 126 of file dma.c.

References MFC\_CMD\_PUT.

```
133 {
134     return spe_do_mfc_put(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_PUT);
135 }
```

**int \_base\_spe\_mfcio\_putb ( spe\_context\_ptr\_t spectx, unsigned int ls, void \*ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_putb function is identical to \_base\_spe\_mfcio\_put except that it places a putb (put with barrier) DMA command on the proxy command queue. The barrier form ensures that this command and all sequence commands with the same tag identifier as this command are locally ordered with respect to all previously issued commands with the same tag group and command queue.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

## Returns

On success, return 0. On failure, -1 is returned.

Definition at line 137 of file dma.c.

References MFC\_CMD\_PUTB.

145     return spe_do_mfc_put(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_PUTB);
146 }
```

**int \_base\_spe\_mfcio\_putf ( spe\_context\_ptr\_t spectx, unsigned int ls, void \*ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_putf function is identical to \_base\_spe\_mfcio\_put except that it places a putf (put with fence) DMA command on the proxy command queue. The fence form ensures that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

## Returns

On success, return 0. On failure, -1 is returned.

- [int \\_base\\_spe\\_image\\_close](#) ([spe\\_program\\_handle\\_t](#) \*handle)

### 3.11.1 Function Documentation

`int _base_spe_image_close ( spe_program_handle_t * handle )`

`_base_spe_image_close` unmaps an SPE ELF object that was previously mapped using `spe_open_image`.

## Parameters

<i>handle</i>	handle to open file
---------------	---------------------

## Return values

<i>0</i>	On success, spe_close_image returns 0.
<i>-1</i>	On failure, -1 is returned and errno is set appropriately. Possible values for errno: EINVAL From spe_close_image, this indicates that the file, specified by filename, was not previously mapped by a call to spe_open_image.

Definition at line 96 of file image.c.

References spe\_program\_handle::elf\_image, image\_handle::map\_size, image\_handle::speh, and spe\_program\_handle::toe\_shadow.

```

97 {
98     int ret = 0;
99     struct image_handle *ih;
100
101    if (!handle) {
102        errno = EINVAL;
103        return -1;
104    }
105
106    ih = (struct image_handle *)handle;
107
108    if (!ih->speh.elf_image || !ih->map_size) {

120 }
```

**spe\_program\_handle\_t\* \_base\_spe\_image\_open ( const char \*filename )**

\_base\_spe\_image\_open maps an SPE ELF executable indicated by filename into system memory and returns the mapped address appropriate for use by the spe\_create\_thread API. It is often more convenient/appropriate to use the loading methodologies where SPE ELF objects are converted to PPE static or shared libraries with symbols which point to the SPE ELF objects after these special libraries are loaded. These libraries are then linked with the associated PPE code to provide a direct symbol reference to the SPE ELF object. The symbols in this scheme are equivalent to the address returned from the spe\_open\_image function. SPE ELF objects loaded using this function are not shared with other processes, but SPE ELF objects loaded using the other scheme, mentioned above, can be shared if so desired.

## Parameters

<i>filename</i>	Specifies the filename of an SPE ELF executable to be loaded and mapped into system memory.
-----------------	---------------------------------------------------------------------------------------------

## Returns

On success, spe\_open\_image returns the address at which the specified SPE ELF object has been mapped. On failure, NULL is returned and errno is set appropriately.

Possible values for errno include:

EACCES The calling process does not have permission to access the specified file.

EFAULT The filename parameter points to an address that was not contained in the calling process's address space.

A number of other errno values could be returned by the open(2), fstat(2), mmap(2), munmap(2), or close(2) system calls which may be utilized by the spe\_open\_image or spe\_close\_image functions.

### 3.16.1 Macro Definition Documentation

**#define SIGSPE SIGURG**

SIGSPE maps to SIGURG

Definition at line 219 of file libspe2-types.h.

**#define SPE\_AFFINITY\_MEMORY 0x00002000**

Definition at line 182 of file libspe2-types.h.

Referenced by \_base\_spe\_context\_create().

**#define SPE\_CALLBACK\_ERROR 6**

Definition at line 194 of file libspe2-types.h.

Referenced by \_base\_spe\_context\_run().

**#define SPE\_CALLBACK\_NEW 1**

Definition at line 260 of file libspe2-types.h.

Referenced by \_base\_spe\_callback\_handler\_register().

**#define SPE\_CALLBACK\_UPDATE 2**

Definition at line 261 of file libspe2-types.h.

Referenced by \_base\_spe\_callback\_handler\_register().

**#define SPE\_CFG\_SIGNOTIFY1\_OR 0x00000010**

Flags for spe\_context\_create

Definition at line 176 of file libspe2-types.h.

Referenced by \_base\_spe\_context\_create().

**#define SPE\_CFG\_SIGNOTIFY2\_OR 0x00000020**

Definition at line 177 of file libspe2-types.h.

Referenced by \_base\_spe\_context\_create().

**#define SPE\_COUNT\_PHYSICAL\_CPU\_NODES 1**

Definition at line 265 of file libspe2-types.h.

Referenced by \_base\_spe\_cpu\_info\_get().

**#define SPE\_COUNT\_PHYSICAL\_SPES 2**

Definition at line 266 of file libspe2-types.h.

Referenced by \_base\_spe\_cpu\_info\_get().

**#define SPE\_COUNT\_USABLE\_SPES 3**

Definition at line 267 of file libspe2-types.h.  
 Referenced by `_base_spe_cpu_info_get()`.

**#define SPE\_DEFAULT\_ENTRY UINT\_MAX**

Flags for `_base_spe_context_run`  
 Definition at line 253 of file libspe2-types.h.  
 Referenced by `_base_spe_context_run()`.

**#define SPE\_DMA\_ALIGNMENT 0x0008**

Runtime exceptions  
 Definition at line 210 of file libspe2-types.h.

**#define SPE\_DMA\_SEGMENTATION 0x0020**

Definition at line 212 of file libspe2-types.h.

**#define SPE\_DMA\_STORAGE 0x0040**

Definition at line 213 of file libspe2-types.h.

**#define SPE\_EVENT\_ALL\_EVENTS****Value:**

```
SPE_EVENT_OUT_INTR_MBOX | \
    SPE_EVENT_IN_MBOX | \

Referenced by \_base\_spe\_mfcio\_tag\_status\_read().

### 3.16.2 Typedef Documentation

**typedef struct spe\_context\* spe\_context\_ptr\_t**

spe\_context\_ptr\_t This pointer serves as the identifier for a specific SPE context throughout the API (where needed)

Definition at line 83 of file libspe2-types.h.

**typedef union spe\_event\_data spe\_event\_data\_t**

spe\_event\_data\_t User data to be associated with an event

**typedef void\* spe\_event\_handler\_ptr\_t**

Definition at line 159 of file libspe2-types.h.

**typedef int spe\_event\_handler\_t**

Definition at line 160 of file libspe2-types.h.

**typedef struct spe\_event\_unit spe\_event\_unit\_t**

spe\_event\_t

**typedef struct spe\_gang\_context\* spe\_gang\_context\_ptr\_t**

spe\_gang\_context\_ptr\_t This pointer serves as the identifier for a specific SPE gang context throughout the API (where needed)

Definition at line 106 of file libspe2-types.h.

**typedef struct spe\_program\_handle spe\_program\_handle\_t**

SPE program handle Structure [spe\\_program\\_handle](#) per CESOF specification libspe2 applications usually only keep a pointer to the program handle and do not use the structure directly.

**typedef struct spe\_stop\_info spe\_stop\_info\_t**

spe\_stop\_info\_t

### 3.16.3 Enumeration Type Documentation

**enum ps\_area**

Enumerator

*SPE\_MSSYNC\_AREA*

*SPE\_MFC\_COMMAND\_AREA*

*SPE\_CONTROL\_AREA*

*SPE\_SIG\_NOTIFY\_1\_AREA*

*SPE\_SIG\_NOTIFY\_2\_AREA*

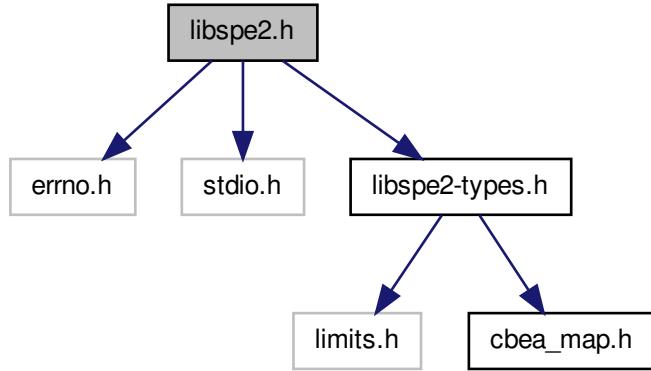

Definition at line 171 of file libspe2-types.h.

```
171 { SPE_MSSYNC_AREA, SPE_MFC_COMMAND_AREA,
      SPE_CONTROL_AREA, SPE_SIG_NOTIFY_1_AREA,
      SPE_SIG_NOTIFY_2_AREA };
```

## 3.17 libspe2.h File Reference

```
#include <errno.h>

### 3.18.1 Macro Definition Documentation

**#define SPE\_EMULATED\_LOADER\_FILE "/usr/lib/spe/emulated-loader.bin"**

Definition at line 31 of file load.c.

### 3.18.2 Function Documentation

**int \_base\_spe\_emulated\_loader\_present ( void )**

Check if the emulated loader is present in the filesystem

Returns

Non-zero if the loader is available, otherwise zero.

Definition at line 159 of file load.c.

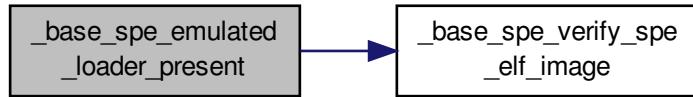

References **\_base\_spe\_verify\_spe\_elf\_image()**.

Referenced by **\_base\_spe\_context\_create()**.

```

160 {
161     spe_program_handle_t *loader = emulated_loader_program();
162
163     if (!loader)
164         return 0;
165
166     return !_base_spe_verify_spe_elf_image(loader);
167 }
  
```

Here is the call graph for this function:

**int \_base\_spe\_program\_load ( spe\_context\_ptr\_t *spectx*, spe\_program\_handle\_t \* *program* )**

\_base\_spe\_program\_load loads an ELF image into a context

Parameters

<i>spectx</i>	Specifies the SPE context
<i>program</i>	handle to the ELF image

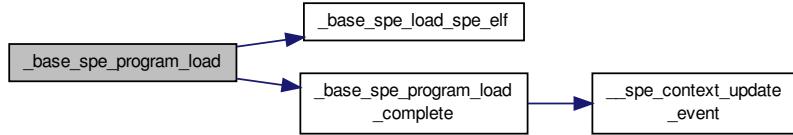

Definition at line 203 of file load.c.

References \_base\_spe\_load\_spe\_elf(), \_base\_spe\_program\_load\_complete(), spe\_context::base\_private, DEBUG\_PRINTF, spe\_context\_base\_priv::emulated\_entry, spe\_ld\_info::entry, spe\_context\_base\_priv::entry, spe\_context\_base\_priv::flags, spe\_context\_base\_priv::loaded\_program, spe\_context\_base\_priv::mem\_mmap\_base, SPE\_ISOLATE, and SPE\_ISOLATE\_EMULATE.

### 3.19.1 Function Documentation

**int `_base_spe_in_mbox_status ( spe_context_ptr_t spectx )`**

The `_base_spe_in_mbox_status` function fetches the status of the SPU inbound mailbox for the SPE thread specified by the `speid` parameter. A 0 value is return if the mailbox is full. A non-zero value specifies the number of available (32-bit) mailbox entries.

Parameters

<code>spectx</code>	Specifies the SPE context whose mailbox status is to be read.
---------------------	---------------------------------------------------------------

Returns

On success, returns the current status of the mailbox, respectively. On failure, -1 is returned.

Here is the call graph for this function:

**int \_base\_spe\_out\_mbox\_read ( spe\_context\_ptr\_t spectx, unsigned int mbox\_data[], int count )**

The `_base_spe_out_mbox_read` function reads the contents of the SPE outbound interrupting mailbox for the SPE thread speid.

The call will not block until the read request is satisfied, but instead return up to count currently available mailbox entries.

`spe_stat_out_intr_mbox` can be called to ensure that data is available prior to reading the outbound interrupting mailbox.

**Parameters**

<code>spectx</code>	Specifies the SPE thread whose outbound mailbox is to be read.
<code>mbox_data</code>	
<code>count</code>	

**Return values**

<code>&gt;0</code>	the number of 32-bit mailbox messages read
<code>=0</code>	no data available
<code>-1</code>	error condition and errno is set Possible values for errno: EINVAL speid is invalid Exxxx what else do we need here??

### 3.21.2 Function Documentation

`int _base_spe_context_run ( spe_context_ptr_t spe, unsigned int * entry, unsigned int runflags, void * argp, void * envp, spe_stop_info_t * stopinfo )`

`_base_spe_context_run` starts execution of an SPE context with a loaded image

Parameters

<code>spectx</code>	Specifies the SPE context
<code>entry</code>	entry point for the SPE programm. If set to 0, entry point is determined by the ELF loader.
<code>runflags</code>	valid values are: <code>SPE_RUN_USER_REGS</code> Specifies that the SPE setup registers r3, r4, and r5 are initialized with the 48 bytes pointed to by <code>argp</code> . <code>SPE_NO_CALLBACKS</code> do not use built in library functions.
<code>argp</code>	An (optional) pointer to application specific data, and is passed as the second parameter to the SPE program.
<code>envp</code>	An (optional) pointer to environment specific data, and is passed as the third parameter to the SPE program.

### 3.23.1 Detailed Description

`spebase.h` contains the public API funtions

Definition in file `spebase.h`.

### 3.23.2 Macro Definition Documentation

`#define __PRINTF( fmt, args... ) { fprintf(stderr,fmt ,## args); }`

Definition at line 34 of file `spebase.h`.

`#define CNTL_OFFSET 0x04000`

Definition at line 124 of file `spebase.h`.

Referenced by `_base_spe_context_create()`.

`#define CNTL_SIZE 0x1000`

Definition at line 119 of file `spebase.h`.

Referenced by `_base_spe_context_create()`.

`#define DEBUG_PRINTF( fmt, args... )`

Definition at line 38 of file `spebase.h`.

`#define LS_SIZE 0x40000 /* 256K (in bytes) */`

Definition at line 115 of file `spebase.h`.

**#define MFC\_OFFSET 0x03000**

Definition at line 123 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define MFC\_SIZE 0x1000**

Definition at line 117 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define MSS\_SIZE 0x1000**

Definition at line 118 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define MSSYNC\_OFFSET 0x00000**

Definition at line 122 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define PSMAP\_SIZE 0x20000 /\* 128K (in bytes) \*/**

Definition at line 116 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define SIGNAL1\_OFFSET 0x14000**

Definition at line 125 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define SIGNAL2\_OFFSET 0x1c000**

Definition at line 126 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define SIGNAL\_SIZE 0x1000**

Definition at line 120 of file spebase.h.

Referenced by \_base\_spe\_context\_create().

**#define SPE\_EMULATE\_PARAM\_BUFFER 0x3e000**

Location of the PPE-assisted library call buffer for emulated isolation contexts.

Definition at line 132 of file spebase.h.

Referenced by \_base\_spe\_handle\_library\_callback().

**#define SPE\_PROGRAM\_ISO\_LOAD\_COMPLETE 0x2206**

Definition at line 143 of file spebase.h.

Referenced by \_base\_spe\_context\_run().

**#define SPE\_PROGRAM\_ISOLATED\_STOP 0x2200**

Isolated exit codes: 0x220x

Definition at line 142 of file spebase.h.

Referenced by \_base\_spe\_context\_run().

```
#define SPE_PROGRAM_LIBRARY_CALL 0x2100
```

Definition at line 137 of file spebase.h.

Referenced by `_base_spe_context_run()`.

```
#define SPE_PROGRAM_NORMAL_END 0x2000
```

Definition at line 136 of file spebase.h.

Referenced by `_base_spe_context_run()`.

### 3.23.3 Enumeration Type Documentation

**enum fd\_name**

NOTE: NUM\_MBOX\_FDS must always be the last element in the enumeration

Enumerator

```
FD_MBOX
FD_MBOX_STAT
FD_IBOX
FD_IBOX_NB
FD_IBOX_STAT
FD_WBOX
FD_WBOX_NB
FD_WBOX_STAT
FD_SIG1
FD_SIG2
FD_MFC
FD_MSS
NUM_MBOX_FDS
```

Definition at line 42 of file spebase.h.

```
42      {
43      FD_MBOX,
44      FD_MBOX_STAT,
45      FD_IBOX,
46      FD_IBOX_NB,
47      FD_IBOX_STAT,
48      FD_WBOX,
49      FD_WBOX_NB,
50      FD_WBOX_STAT,
51      FD_SIG1,
52      FD_SIG2,
53      FD_MFC,
54      FD_MSS,
55      NUM_MBOX_FDS
56 };
```

### 3.23.4 Function Documentation

```
int __base_spe_event_source_acquire ( struct spe_context * spectx, enum fd_name fdesc )
```

`__base_spe_event_source_acquire` opens a file descriptor to the specified event source

Parameters

<i>spectx</i>	Specifies the SPE context
<i>fdesc</i>	Specifies the event source

```
void __base_spe_event_source_release ( struct spe_context *spectx, enum fd_name fdesc )
```

*\_\_base\_spe\_event\_source\_release* releases the file descriptor to the specified event source

Parameters

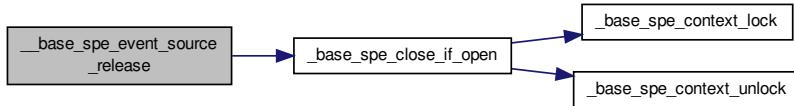

<i>spectx</i>	Specifies the SPE context
<i>fdesc</i>	Specifies the event source

Definition at line 79 of file accessors.c.

References *\_\_base\_spe\_close\_if\_open()*.

```
80 {
81     __base_spe_close_if_open(spe, fdesc);
82 }
```

Here is the call graph for this function:

```
int __base_spe_spe_dir_get ( struct spe_context *spectx )
```

*\_\_base\_spe\_spe\_dir\_get* return the file descriptor of the SPE directory in spufs

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

```
int __base_spe_stop_event_source_get ( spe_context_ptr_t spe )
```

*\_\_base\_spe\_stop\_event\_source\_get*

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

speevent users read from this end

Definition at line 92 of file accessors.c.

References *spe\_context::base\_private*, and *spe\_context\_base\_priv::ev\_pipe*.

```
93 {
94     return spe->base_private->ev_pipe[1];
95 }
```

```
int __base_spe_stop_event_target_get ( spe_context_ptr_t spe )
```

*\_\_base\_spe\_stop\_event\_target\_get*

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

speevent writes to this end

Definition at line 100 of file accessors.c.

References spe\_context::base\_private, and spe\_context\_base\_priv::ev\_pipe.

```
101 {
102     return spe->base_private->ev_pipe[0];
103 }
```

### **void \_\_spe\_context\_update\_event( void )**

\_\_spe\_context\_update\_event internal function for gdb notification.

Referenced by \_\_base\_spe\_context\_destroy(), and \_\_base\_spe\_program\_load\_complete().

### **int \_\_base\_spe\_callback\_handler\_deregister( unsigned int callnum )**

unregister a handler function for the specified number NOTE: unregistering a handler from call zero and one is ignored.

Definition at line 78 of file lib\_builtin.c.

References MAX\_CALLNUM, and RESERVED.

```
79 {
80     errno = 0;
81     if (callnum > MAX_CALLNUM) {
82         errno = EINVAL;
83         return -1;
84     }
85     if (callnum < RESERVED) {
86         errno = EACCES;
87         return -1;
88     }
89     if (handlers[callnum] == NULL) {
90         errno = ESRCH;
91         return -1;
92     }
93     handlers[callnum] = NULL;
94     return 0;
95 }
96 }
```

### **void\* \_\_base\_spe\_callback\_handler\_query( unsigned int callnum )**

query a handler function for the specified number

Definition at line 98 of file lib\_builtin.c.

References MAX\_CALLNUM.

```
99 {
100     errno = 0;
101
102     if (callnum > MAX_CALLNUM) {
103         errno = EINVAL;
104         return NULL;
105     }
106     if (handlers[callnum] == NULL) {
107         errno = ESRCH;
108         return NULL;
109     }
110     return handlers[callnum];
111 }
```

**int \_base\_spe\_callback\_handler\_register ( void \* *handler*, unsigned int *callnum*, unsigned int *mode* )**

register a handler function for the specified number NOTE: registering a handler to call zero and one is ignored.

Definition at line 40 of file lib\_builtin.c.

References MAX\_CALLBACK\_NUM, RESERVED, SPE\_CALLBACK\_NEW, and SPE\_CALLBACK\_UPDATE.

```

41 {
42     errno = 0;
43
44     if (callnum > MAX_CALLBACK_NUM) {
45         errno = EINVAL;
46         return -1;
47     }
48
49     switch(mode) {
50     case SPE_CALLBACK_NEW:
51         if (callnum < RESERVED) {
52             errno = EACCES;
53             return -1;
54         }
55         if (handlers[callnum] != NULL) {
56             errno = EACCES;
57             return -1;
58         }
59         handlers[callnum] = handler;
60         break;
61
62     case SPE_CALLBACK_UPDATE:
63         if (handlers[callnum] == NULL) {
64             errno = ESRCH;
65             return -1;
66         }
67         handlers[callnum] = handler;
68         break;
69     default:
70         errno = EINVAL;
71         return -1;
72         break;
73     }
74     return 0;
75 }
76 }
```

**spe\_context\_ptr\_t \_base\_spe\_context\_create ( unsigned int *flags*, spe\_gang\_context\_ptr\_t *gctx*, spe\_context\_ptr\_t *aff\_spe* )**

\_base\_spe\_context.create creates a single SPE context, i.e., the corresponding directory is created in SPUFS either as a subdirectory of a gang or individually (maybe this is best considered a gang of one)  
Parameters

<i>flags</i>	
<i>gctx</i>	specify NULL if not belonging to a gang
<i>aff_spe</i>	specify NULL to skip affinity information

Definition at line 183 of file create.c.

Here is the call graph for this function:

### **int \_base\_spe\_context\_destroy ( spe\_context\_ptr\_t spectx )**

\_base\_spe\_context\_destroy cleans up what is left when an SPE executable has exited. Closes open file handles and unmaps memory areas.

Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

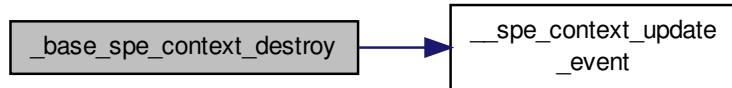

Definition at line 418 of file create.c.

References \_\_spe\_context\_update\_event().

```

419 {
420     int ret = free_spe_context(spe);
421
422     __spe_context_update_event();
423
424     return ret;
425 }
```

Here is the call graph for this function:

**void \_base\_spe\_context\_lock ( spe\_context\_ptr\_t spe, enum fd\_name fd )**

\_base\_spe\_context\_lock locks members of the SPE context

Parameters

<i>spectx</i>	Specifies the SPE context
<i>fd</i>	Specifies the file

Definition at line 91 of file create.c.

References spe\_context::base\_private, and spe\_context\_base\_priv::fd\_lock.

Referenced by \_base\_spe\_close\_if\_open(), and \_base\_spe\_open\_if\_closed().

```

92 {
93     pthread_mutex_lock(&spe->base_private->fd_lock[fdesc]);

```

**int \_base\_spe\_context\_run ( spe\_context\_ptr\_t spe, unsigned int \* entry, unsigned int runflags, void \* argp, void \* envp, spe\_stop\_info\_t \* stopinfo )**

\_base\_spe\_context\_run starts execution of an SPE context with a loaded image

Parameters

<i>spectx</i>	Specifies the SPE context
<i>entry</i>	entry point for the SPE programm. If set to 0, entry point is determined by the ELF loader.
<i>runflags</i>	valid values are: SPE_RUN_USER_REGS Specifies that the SPE setup registers r3, r4, and r5 are initialized with the 48 bytes pointed to by argp. SPE_NO_CALLBACKS do not use built in library functions.
<i>argp</i>	An (optional) pointer to application specific data, and is passed as the second parameter to the SPE program.
<i>envp</i>	An (optional) pointer to environment specific data, and is passed as the third parameter to the SPE program.

### **int \_base\_spe\_gang\_context\_destroy ( spe\_gang\_context\_ptr\_t gctx )**

\_base\_spe\_gang\_context\_destroy destroys a gang context and frees associated resources

Parameters

<i>gctx</i>	Specifies the SPE gang context
-------------	--------------------------------

Definition at line 427 of file create.c.

```

428 {
429     return free_spe_gang_context(gctx);
430 }
```

### **int \_base\_spe\_image\_close ( spe\_program\_handle\_t \* handle )**

\_base\_spe\_image\_close unmaps an SPE ELF object that was previously mapped using spe\_open\_image.

Parameters

<i>handle</i>	handle to open file
---------------	---------------------

Return values

<i>0</i>	On success, spe_close_image returns 0.
<i>-1</i>	On failure, -1 is returned and errno is set appropriately. Possible values for errno: EINVAL From spe_close_image, this indicates that the file, specified by filename, was not previously mapped by a call to spe_open_image.

Definition at line 96 of file image.c.

References spe\_program\_handle::elf\_image, image\_handle::map\_size, image\_handle::speh, and spe\_program\_handle::toe\_shadow.

```

97 {
98     int ret = 0;

117    free(handle);
118
119    return ret;
120 }
```

**spe\_program\_handle\_t\* \_base\_spe\_image\_open ( const char \*filename )**

`_base_spe_image_open` maps an SPE ELF executable indicated by `filename` into system memory and returns the mapped address appropriate for use by the `spe_create_thread` API. It is often more convenient/appropriate to use the loading methodologies where SPE ELF objects are converted to PPE static or shared libraries with symbols which point to the SPE ELF objects after these special libraries are loaded. These libraries are then linked with the associated PPE code to provide a direct symbol reference to the SPE ELF object. The symbols in this scheme are equivalent to the address returned from the `spe_open_image` function. SPE ELF objects loaded using this function are not shared with other processes, but SPE ELF objects loaded using the other scheme, mentioned above, can be shared if so desired.

Parameters

<code>filename</code>	Specifies the filename of an SPE ELF executable to be loaded and mapped into system memory.
-----------------------	---------------------------------------------------------------------------------------------

Returns

On success, `spe_open_image` returns the address at which the specified SPE ELF object has been mapped. On failure, `NULL` is returned and `errno` is set appropriately.

Possible values for `errno` include:

`EACCES` The calling process does not have permission to access the specified file.

`EFAULT` The `filename` parameter points to an address that was not contained in the calling process's address space.

A number of other `errno` values could be returned by the `open(2)`, `fstat(2)`, `mmap(2)`, `munmap(2)`, or `close(2)` system calls which may be utilized by the `spe_open_image` or `spe_close_image` functions.

### **int .base\_spe.in mbox\_status ( spe\_context\_ptr\_t spectx )**

The .base\_spe.in mbox\_status function fetches the status of the SPU inbound mailbox for the SPE thread specified by the speid parameter. A 0 value is returned if the mailbox is full. A non-zero value specifies the number of available (32-bit) mailbox entries.

Parameters

spectx	Specifies the SPE context whose mailbox status is to be read.
--------	---------------------------------------------------------------

Returns

On success, returns the current status of the mailbox, respectively. On failure, -1 is returned.

218 }
```

Here is the call graph for this function:

**int \_base\_spe\_in\_mbox\_write ( spe\_context\_ptr\_t *spectx*, unsigned int *mbox\_data[]*, int *count*, int *behavior\_flag* )**

The `_base_spe_in_mbox_write` function writes `mbox_data` to the SPE inbound mailbox for the SPE thread `speid`.

If the behavior flag indicates `ALL_BLOCKING` the call will try to write exactly `count` mailbox entries and block until the write request is satisfied, i.e., exactly `count` mailbox entries have been written.

If the behavior flag indicates `ANY_BLOCKING` the call will try to write up to `count` mailbox entries, and block until the write request is satisfied, i.e., at least 1 mailbox entry has been written.

If the behavior flag indicates `ANY_NON_BLOCKING` the call will not block until the write request is satisfied but instead write whatever is immediately possible and return the number of mailbox entries written. `spe_stat_in_mbox` can be called to ensure that data can be written prior to calling the function.

## Parameters

<code>spectx</code>	Specifies the SPE thread whose outbound mailbox is to be read.
<code>mbox_data</code>	

<i>count</i>	
<i>behavior_flag</i>	ALL_BLOCKING ANY_BLOCKING ANY_NON_BLOCKING

Return values

<i>&gt;=0</i>	the number of 32-bit mailbox messages written
<i>-1</i>	error condition and errno is set Possible values for errno: EINVAL spectx is invalid Exxxx what else do we need here??

**void\* \_base\_spe\_ls\_area\_get ( struct spe\_context \* *spectx* )**

\_base\_spe\_ls\_area\_get returns a pointer to the start of the memory mapped local store area  
Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

**int \_base\_spe\_ls\_size\_get ( spe\_context\_ptr\_t *spe* )**

\_base\_spe\_ls\_size\_get returns the size of the local store area  
Parameters

<i>spectx</i>	Specifies the SPE context
---------------	---------------------------

Definition at line 105 of file accessors.c.

References LS\_SIZE.

```
106 {
107     return LS_SIZE;
108 }
```

**int \_base\_spe\_mfcio\_get ( spe\_context\_ptr\_t *spectx*, unsigned int *ls*, void \* *ea*, unsigned int *size*,  
unsigned int *tag*, unsigned int *tid*, unsigned int *rid* )**

The \_base\_spe\_mfcio\_get function places a get DMA command on the proxy command queue of the SPE thread specified by speid. The get command transfers size bytes of data starting at the effective address specified by ea to the local store address specified by ls. The DMA is identified by the tag id specified by tag and performed according to the transfer class and replacement class specified by tid and rid respectively.  
Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.

<i>rid</i>	Specifies the replacement class identifier of the DMA command.
------------	----------------------------------------------------------------

## Returns

On success, return 0. On failure, -1 is returned.

Definition at line 160 of file dma.c.

References MFC\_CMD\_GET.

```
167 {
168     return spe_do_mfc_get(spectx, ls, ea, size, tag, tid, rid, MFC_CMD_GET);
169 }
```

**int \_base\_spe\_mfcio\_getb ( spe\_context\_ptr\_t spectx, unsigned int ls, void \* ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_getb function is identical to \_base\_spe\_mfcio\_get except that it places a getb (get with barrier) DMA command on the proxy command queue. The barrier form ensures that this command and all sequence commands with the same tag identifier as this command are locally ordered with respect to all previously issued commands with the same tag group and command queue.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

## Returns

On success, return 0. On failure, -1 is returned.

Definition at line 171 of file dma.c.

References MFC\_CMD\_GETB.

```
178 {
179     return spe_do_mfc_get(spectx, ls, ea, size, tag, rid, rid, MFC_CMD_GETB);

```

**int \_base\_spe\_mfcio\_getf ( spe\_context\_ptr\_t spectx, unsigned int ls, void \* ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_getf function is identical to \_base\_spe\_mfcio\_get except that it places a getf (get with fence) DMA command on the proxy command queue. The fence form ensure that this command is locally ordered with respect to all previously issued commands with the same tag group and command queue.

## Parameters

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.

<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

**int \_base\_spe\_mfcio\_put ( spe\_context\_ptr\_t spectx, unsigned int ls, void \* ea, unsigned int size, unsigned int tag, unsigned int tid, unsigned int rid )**

The \_base\_spe\_mfcio\_put function places a put DMA command on the proxy command queue of the SPE thread specified by speid. The put command transfers size bytes of data starting at the local store address specified by ls to the effective address specified by ea. The DMA is identified by the tag id specified by tag and performed according transfer class and replacement class specified by tid and rid respectively.

**Parameters**

<i>spectx</i>	Specifies the SPE context
<i>ls</i>	Specifies the starting local store destination address.
<i>ea</i>	Specifies the starting effective address source address.
<i>size</i>	Specifies the size, in bytes, to be transferred.
<i>tag</i>	Specifies the tag id used to identify the DMA command.
<i>tid</i>	Specifies the transfer class identifier of the DMA command.
<i>rid</i>	Specifies the replacement class identifier of the DMA command.

**Returns**

On success, return 0. On failure, -1 is returned.

### `int _base_spe_out_intr_mbox_status ( spe_context_ptr_t spectx )`

The `_base_spe_out_intr_mbox_status` function fetches the status of the SPU outbound interrupt mailbox for the SPE thread specified by the `speid` parameter. A 0 value is returned if the mailbox is empty. A non-zero

value specifies the number of 32-bit unread mailbox entries.

## Parameters

<i>spectx</i>	Specifies the SPE context whose mailbox status is to be read.
---------------	---------------------------------------------------------------

## Returns

On success, returns the current status of the mailbox, respectively. On failure, -1 is returned.

231
232     return 0;
233 }
```

Here is the call graph for this function:

### `void _base_spe_program_load_complete ( spe_context_ptr_t spectx )`

Signal that the program load has completed. For normal apps, this is called directly in the load path. For (emulated) isolated apps, the load is asynchronous, so this needs to be called when we know that the load has completed

Precondition

`spe->base_priv->loaded_program` is a valid SPE program

Parameters

<code>spectx</code>	The spe context that has been loaded.
---------------------	---------------------------------------

Register the SPE program's start address with the oprofile and gdb, by writing to the object-id file.

Definition at line 38 of file load.c.

References `_spe_context_update_event()`, `spe_context::base_private`, `DEBUG_PRINTF`, `spe_program_handle::elf_image`, `spe_context::base_priv::fd_spe_dir`, and `spe_context::base_priv::loaded_program`.

Referenced by `_base_spe_context_run()`, and `_base_spe_program_load()`.

```

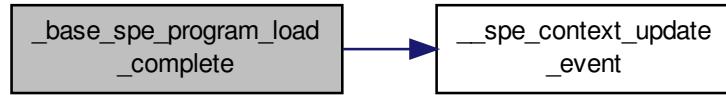

39 {
40     int objfd, len;
41     char buf[20];
42     spe_program_handle_t *program;
```

```

43     program = spectx->base_private->loaded_program;
44
45     if (!program || !program->elf_image) {
46         DEBUG_PRINTF("%s called, but no program loaded\n", __func__);
47         return;
48     }
49
50     objfd = openat(spectx->base_private->fd_spe_dir, "object-id", O_RDWR);
51     if (objfd < 0)
52         return;
53
54     len = sprintf(buf, "%p", program->elf.image);
55     write(objfd, buf, len + 1);
56     close(objfd);
57
58     __spe_context_update_event();
59
60 }

```

Here is the call graph for this function:

**void\* \_base\_spe\_ps\_area\_get ( struct spe\_context \*spectx, enum ps\_area area )**

\_base\_spe\_ps\_area\_get returns a pointer to the start of memory mapped problem state area  
Parameters

<i>spectx</i>	Specifies the SPE context
<i>area</i>	specifies the area to map

**int \_base\_spe\_signal\_write ( spe\_context\_ptr\_t spectx, unsigned int signal\_reg, unsigned int data )**

The \_base\_spe\_signal\_write function writes data to the signal notification register specified by signal\_reg for the SPE thread specified by the speid parameter.

Parameters

<i>spectx</i>	Specifies the SPE context whose signal register is to be written to.
<i>signal_reg</i>	Specified the signal notification register to be written. Valid signal notification registers are: SPE_SIG_NOTIFY_REG_1 SPE signal notification register 1 SPE_SIG_NOTIFY_REG_2 SPE signal notification register 2

data	The 32-bit data to be written to the specified signal notification register.
------	------------------------------------------------------------------------------

## Returns

On success, spe\_write\_signal returns 0. On failure, -1 is returned.

353 }
```

Here is the call graph for this function:

```
int _base_spe_stop_reason_get ( spe_context_ptr_t spectx )
```

\_base\_spe\_stop\_reason\_get

Parameters

<i>spectx</i>	one thread for which to check why it was stopped
---------------	--------------------------------------------------

Return values

<i>0</i>	success - eventid and eventdata set appropriately
<i>1</i>	spe has not stopped after checking last, so no data was written to event
<i>-1</i>	an error has happened, event was not touched, errno gets set Possible values for errno: EINVAL speid is invalid Exxxx what else do we need here??

```
int _base_spe_stop_status_get ( spe_context_ptr_t spectx )
```

\_base\_spe\_stop\_status\_get

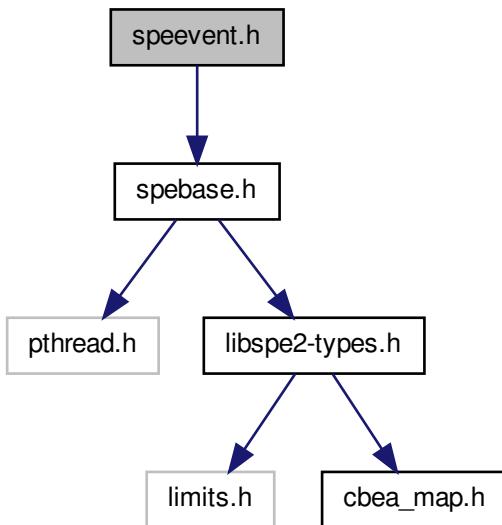

Parameters

<i>spectx</i>	Specifies the SPE context
